## TITLE OF THE INVENTION

METHODS OF INHIBITING ORTHOPOXVIRUS REPLICATION WITH  
NUCLEOSIDE COMPOUNDS

## 5 FIELD OF THE INVENTION

The present invention is concerned with methods of inhibiting orthopoxvirus replication and methods for treating orthopoxvirus infections with certain nucleoside compounds and derivatives thereof. The compounds are particularly useful for inhibiting the replication of vaccinia, variola, cowpox, and 10 monkeypox virus and for the treatment of vaccinia, variola, cowpox, and monkeypox virus infections. Another aspect of the present invention provides for the use of the nucleoside compounds and derivatives thereof and their pharmaceutical compositions for the manufacture of a medicament for the inhibition of orthopoxvirus replication and/or for the treatment of orthopoxvirus infection. Yet a further aspect of the present 15 invention provides for the nucleoside compounds and derivatives thereof and their pharmaceutical compositions for use as a medicament for the inhibition of orthopoxvirus replication and/or for the treatment of orthopoxvirus infection.

## BACKGROUND OF THE INVENTION

20 Orthopoxvirus is a genus of the *Poxviridae* family of complex DNA viruses that replicate in the cytoplasm of vertebrate and invertebrate cells. The *Poxviridae* family is characterized by having a large complex virion containing enzymes that synthesize mRNA, a genome composed of a single linear double-stranded DNA molecule of 130-300 kilobase pairs with a hairpin loop at each end, 25 and a cytoplasmic site of replication. Members of the orthopoxvirus genus include cowpox, monkeypox, vaccinia, and variola virus [for a description of the *Poxviridae* family, reference is made to B. Moss, "Poxviridae: The Viruses and Their Replication," in *Fields Virology*, B.N. Fields, et al., Eds., 3rd ed., Ch. 83, pages 2637-2671 (1996)]. Variola virus is the agent responsible for smallpox infections.

30 Smallpox infections were effectively eradicated subsequent to the introduction of prophylactic vaccinations with cowpox and vaccinia virus. However, most of the human populations worldwide are no longer immune to smallpox as a result of the discontinuation of routine vaccination in the early 1980's.

35 There are very few compounds available as therapeutics against orthopoxvirus infections. Two drugs under investigation are cidofovir and ribavirin.

Cidofovir is the generic name for (S)-1-[3-hydroxy-2-(phosphonylmethoxy)-propyl]cytosine [(S)-HPMPC] which is currently the leading agent for the treatment of orthopoxvirus infections in humans. It is potent against vaccinia and cowpox virus infection in mice when administered subcutaneously or intraperitoneally. However,

5 cidofovir's therapeutic utility is limited by safety concerns as well as lack of oral bioavailability [see D.F. Smee et al., "Effects of cidofovir on the pathogenesis of a lethal vaccinia virus respiratory infection in mice," Antiviral Res., 52: 55-62 (2001) and references cited therein]. Inhibition of vaccinia virus is considered in the art to be predictive of inhibitory activity against other orthopoxviruses, including variola; see

10 E. De Clercq, "Vaccinia Virus Inhibitors as a Paradigm for the Chemotherapy of Poxvirus Infections," Clin. Microbiol. Rev., 14: 382-397 (2001).

Ribavirin has also been found to inhibit vaccinia virus and other orthopoxvirus replication in cell culture (see J.H. Huffman et al., "In vitro effect of 1- $\beta$ -D-ribofuranosyl-1,2,4-triazole-3-carboxamide on DNA and RNA viruses," Antimicrobial Agents and Chemotherapy, 3: 235-241 (1973) and D.F. Smee et al., "Potential of the IMP dehydrogenase inhibitors for antiviral therapies of poxvirus infections," Antiviral Res., 37: A89 (1998)]. Ribavirin was also reported to suppress vaccinia virus-induced lesions in a mouse model and to effectively treat vaccinia keratitis in rabbits. However, ribavirin causes anemia during prolonged

20 administration and at high doses has certain immunosuppressive properties limiting its clinical usefulness against orthopoxvirus.

Consequently, there exists a need for more effective anti-orthopoxvirus agents particularly as a result of the threat of either variola (smallpox) or monkeypox viruses in biowarfare or bioterrorism. Preferably such agents should be effective

25 when administered orally and be safe and well-tolerated by the host.

It has now been found that nucleoside compounds of the present invention and certain derivatives thereof are potent inhibitors of orthopoxvirus replication and in particular of vaccinia, variola, cowpox, and monkeypox virus replication. The instant nucleoside compounds and derivatives thereof are useful to

30 treat orthopoxvirus infection and in particular vaccinia, variola, cowpox, and monkeypox virus infection.

It is therefore an object of the present invention to provide nucleoside compounds and certain derivatives thereof which are useful as inhibitors of the replication of orthopoxvirus and in particular as inhibitors of the replication of

35 vaccinia, variola, cowpox, and monkeypox virus.

It is another object of the present invention to provide nucleoside compounds and certain derivatives thereof which are useful in the treatment of orthopoxvirus infection and in particular in the treatment of vaccinia, variola, cowpox, and monkeypox virus infection.

5 It is another object of the present invention to provide pharmaceutical compositions comprising the nucleoside compounds of the present invention in association with a pharmaceutically acceptable carrier.

10 It is another object of the present invention to provide pharmaceutical compositions comprising the nucleoside compounds and derivatives of the present invention for use as inhibitors of orthopoxvirus replication and in particular as inhibitors of vaccinia, variola, cowpox, and monkeypox virus replication.

15 It is another object of the present invention to provide pharmaceutical compositions comprising the nucleoside compounds and derivatives of the present invention for use in the treatment of orthopoxvirus infection and in particular in the treatment of vaccinia, variola, cowpox, and monkeypox virus infection.

It is another object of the present invention to provide pharmaceutical compositions comprising the nucleoside compounds and derivatives of the present invention in combination with other agents active against orthopoxvirus and in particular against vaccinia, variola, cowpox, and monkeypox virus.

20 It is another object of the present invention to provide methods for the inhibition of orthopoxvirus replication and in particular for the inhibition of vaccinia, variola, cowpox, and monkeypox virus replication.

25 It is another object of the present invention to provide methods for the treatment of orthopoxvirus infection and in particular for the treatment of vaccinia, variola, cowpox, and monkeypox virus infection.

30 It is another object of the present invention to provide methods for the treatment of orthopoxvirus infection in combination with other agents active against orthopoxvirus and in particular for the treatment of vaccinia, variola, cowpox, and monkeypox virus infection in combination with other agents active against vaccinia, variola, cowpox, and monkeypox virus infection.

It is another object of the present invention to provide nucleoside compounds and certain derivatives thereof and their pharmaceutical compositions for use as a medicament for the inhibition of orthopoxvirus replication and/or the treatment of orthopoxvirus infection and in particular for the inhibition of vaccinia,

variola, cowpox, and monkeypox virus replication and/or the treatment of vaccinia, variola, cowpox, and monkeypox virus infection.

It is another object of the present invention to provide for the use of the nucleoside compounds and certain derivatives thereof of the present invention and their pharmaceutical compositions for the manufacture of a medicament for the inhibition of orthopoxvirus replication and/or the treatment of orthopoxvirus infection and in particular for the inhibition of vaccinia, variola, cowpox, and monkeypox virus replication and/or the treatment of vaccinia, variola, cowpox, and monkeypox virus infection.

10 These and other objects will become readily apparent from the detailed description which follows.

The term "composition", as in "pharmaceutical composition," is intended to encompass a product comprising the active ingredient(s) and the inert ingredient(s) that make up the carrier, as well as any product which results, directly or indirectly, from combination, complexation or aggregation of any two or more of the ingredients, or from dissociation of one or more of the ingredients, or from other types of reactions or interactions of one or more of the ingredients. Accordingly, the pharmaceutical compositions of the present invention encompass any composition made by admixing a compound of the present invention and a pharmaceutically acceptable carrier.

The terms "administration of" and "administering a" compound should be understood to mean providing a compound of the invention or a prodrug of a compound of the invention to the individual in need.

Another aspect of the present invention is concerned with a method of treating orthopoxvirus infections with a compound of the present invention in combination with one or more agents useful for treating orthopoxvirus infections. Such agents active against orthopoxviruses include, but are not limited to, cidofovir, 5 ribavirin, levovirin, and viramidine. Levovirin is the L-enantiomer of ribavirin which has shown immunomodulatory activity similar to ribavirin. Viramidine represents an analog of ribavirin disclosed in WO 01/60379 (assigned to ICN Pharmaceuticals). In accordance with this method of the present invention, the individual components of the combination can be administered separately at different times during the course of 10 therapy or concurrently in divided or single combination forms. The instant invention is therefore to be understood as embracing all such regimes of simultaneous or alternating treatment, and the term "administering" is to be interpreted accordingly. It will be understood that the scope of combinations of the compounds of this invention with other agents useful for treating orthopoxvirus infection includes in principle any 15 combination with any pharmaceutical composition for treating orthopoxvirus infection. When a compound of the present invention or a pharmaceutically acceptable salt thereof is used in combination with a second therapeutic agent active against orthopoxvirus, the dose of each compound may be either the same as or different from the dose when the compound is used alone.

20 Ribavirin, levovirin, and viramidine may exert their anti-orthopoxvirus effects by modulating intracellular pools of guanine nucleotides via inhibition of the intracellular enzyme inosine monophosphate dehydrogenase (IMPDH). IMPDH is the rate-limiting enzyme on the biosynthetic route in *de novo* guanine nucleotide biosynthesis. Ribavirin is readily phosphorylated intracellularly and the 25 monophosphate derivative is an inhibitor of IMPDH. Thus, inhibition of IMPDH represents another useful target for the discovery of inhibitors of orthopoxvirus replication. Therefore, the compounds of the present invention may also be administered in combination with an inhibitor of IMPDH, such as VX-497, which is disclosed in WO 97/41211 and WO 01/00622 (assigned to Vertex); another IMPDH 30 inhibitor, such as that disclosed in WO 00/25780 (assigned to Bristol-Myers Squibb); or mycophenolate mofetil [see A.C. Allison and E.M. Eugui, Agents Action, 44 (Suppl.): 165 (1993)].

By "pharmaceutically acceptable" is meant that the carrier, diluent, or excipient must be compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

Also included within the present invention are pharmaceutical

5 compositions comprising the nucleoside compounds and derivatives thereof of the present invention in association with a pharmaceutically acceptable carrier. Another example of the invention is a pharmaceutical composition made by combining any of the compounds described above and a pharmaceutically acceptable carrier. Another illustration of the invention is a process for making a pharmaceutical composition

10 comprising combining any of the compounds described above and a pharmaceutically acceptable carrier.

Also included within the present invention are pharmaceutical compositions useful for inhibiting orthopoxvirus replication comprising an effective amount of a compound of the present invention and a pharmaceutically acceptable

15 carrier. Pharmaceutical compositions useful for treating orthopoxvirus infection are also encompassed by the present invention. Additionally, the present invention is directed to a pharmaceutical composition comprising a therapeutically effective amount of a compound of the present invention in combination with a therapeutically effective amount of another agent active against orthopoxvirus. Agents active against

20 orthopoxvirus include, but are not limited to, cidofovir, ribavirin, levovirin, and viramidine.

Another aspect of the present invention provides for the use of the nucleoside compounds and derivatives thereof and their pharmaceutical compositions for the manufacture of a medicament for the inhibition of orthopoxvirus replication, in

25 particular vaccinia virus, variola virus replication, cowpox virus replication, and monkeypox virus replication and/or the treatment of orthopoxvirus infection, in particular vaccinia virus, variola virus infection, cowpox virus infection, and monkeypox virus infection. Yet a further aspect of the present invention provides for the nucleoside compounds and derivatives thereof and their pharmaceutical

30 compositions for use as a medicament for the inhibition of orthopoxvirus replication, in particular vaccinia, variola, cowpox, and monkeypox virus replication, and/or for the treatment of orthopoxvirus infection, in particular vaccinia, variola, cowpox, and monkeypox virus infection.

The pharmaceutical compositions of the present invention comprise a

35 compound of structural formula I as an active ingredient or a pharmaceutically

acceptable salt thereof, and may also contain a pharmaceutically acceptable carrier and optionally other therapeutic ingredients.

The compositions include compositions suitable for oral, rectal, topical, parenteral (including subcutaneous, intramuscular, and intravenous), ocular 5 (ophthalmic), pulmonary (nasal or buccal inhalation), or nasal administration, although the most suitable route in any given case will depend on the nature and severity of the conditions being treated and on the nature of the active ingredient. They may be conveniently presented in unit dosage form and prepared by any of the methods well-known in the art of pharmacy.

10 In practical use, the compounds of structural formula I can be combined as the active ingredient in intimate admixture with a pharmaceutical carrier according to conventional pharmaceutical compounding techniques. The carrier may take a wide variety of forms depending on the form of preparation desired for administration, e.g., oral or parenteral (including intravenous). In preparing the 15 compositions for oral dosage form, any of the usual pharmaceutical media may be employed, such as, for example, water, glycols, oils, alcohols, flavoring agents, preservatives, coloring agents and the like in the case of oral liquid preparations, such as, for example, suspensions, elixirs and solutions; or carriers such as starches, sugars, microcrystalline cellulose, diluents, granulating agents, lubricants, binders, 20 disintegrating agents and the like in the case of oral solid preparations such as, for example, powders, hard and soft capsules and tablets, with the solid oral preparations being preferred over the liquid preparations.

Because of their ease of administration, tablets and capsules represent the most advantageous oral dosage unit form in which case solid pharmaceutical 25 carriers are obviously employed. If desired, tablets may be coated by standard aqueous or nonaqueous techniques. Such compositions and preparations should contain at least 0.1 percent of active compound. The percentage of active compound in these compositions may, of course, be varied and may conveniently be between about 2 percent to about 60 percent of the weight of the unit. The amount of active 30 compound in such therapeutically useful compositions is such that an effective dosage will be obtained. The active compounds can also be administered intranasally as, for example, liquid drops or spray.

The tablets, pills, capsules, and the like may also contain a binder such as gum tragacanth, acacia, corn starch or gelatin; excipients such as dicalcium 35 phosphate; a disintegrating agent such as corn starch, potato starch, alginic acid; a

lubricant such as magnesium stearate; and a sweetening agent such as sucrose, lactose or saccharin. When a dosage unit form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier such as a fatty oil.

Various other materials may be present as coatings or to modify the 5 physical form of the dosage unit. For instance, tablets may be coated with shellac, sugar or both. A syrup or elixir may contain, in addition to the active ingredient, sucrose as a sweetening agent, methyl and propylparabens as preservatives, a dye and a flavoring such as cherry or orange flavor.

Compounds of structural formula I may also be administered 10 parenterally. Solutions or suspensions of these active compounds can be prepared in water suitably mixed with a surfactant such as hydroxy-propylcellulose. Dispersions can also be prepared in glycerol, liquid polyethylene glycols and mixtures thereof in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

15 The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and must be fluid to the extent that easy syringability exists. It must be stable under the conditions of manufacture and storage and must be preserved against 20 the contaminating action of microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol (e.g. glycerol, propylene glycol and liquid polyethylene glycol), suitable mixtures thereof, and vegetable oils.

Any suitable route of administration may be employed for providing a 25 mammal, especially a human with an effective dosage of a compound of the present invention. For example, oral, rectal, topical, parenteral, ocular, pulmonary, nasal, and the like may be employed. Dosage forms include tablets, troches, dispersions, suspensions, solutions, capsules, creams, ointments, aerosols, and the like. Preferably compounds of structural formula I are administered orally.

30 For oral administration to humans, the dosage range is 0.01 to 1000 mg/kg body weight in divided doses. In one embodiment the dosage range is 0.1 to 100 mg/kg body weight in divided doses. In another embodiment the dosage range is 0.5 to 20 mg/kg body weight in divided doses. For oral administration, the compositions are preferably provided in the form of tablets or capsules containing 1.0 35 to 1000 milligrams of the active ingredient, particularly, 1, 5, 10, 15, 20, 25, 50, 75,

100, 150, 200, 250, 300, 400, 500, 600, 750, 800, 900, and 1000 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated.

The effective dosage of active ingredient employed may vary

5 depending on the particular compound employed, the mode of administration, the condition being treated and the severity of the condition being treated. Such dosage may be ascertained readily by a person skilled in the art. This dosage regimen may be adjusted to provide the optimal therapeutic response.

The compounds of the present invention contain one or more

10 asymmetric centers and can thus occur as racemates and racemic mixtures, single enantiomers, diastereomeric mixtures and individual diastereomers. The present invention is meant to comprehend nucleoside compounds having the  $\beta$ -D stereochemical configuration for the five-membered furanose ring as depicted in the structural formula below, that is, nucleoside compounds in which the substituents at

15 C-1 and C-4 of the five-membered furanose ring have the  $\beta$ -stereochemical configuration ("up" orientation as denoted by a bold line).

Some of the compounds described herein contain olefinic double bonds, and unless specified otherwise, are meant to include both E and Z geometric isomers.

20

Some of the compounds described herein may exist as tautomers such as keto-enol tautomers. The individual tautomers as well as mixtures thereof are encompassed with compounds of structural formula I. An example of keto-enol tautomers which are intended to be encompassed within the compounds of the present

25 invention is illustrated below:

Compounds of structural formula I may be separated into their individual diastereoisomers by, for example, fractional crystallization from a suitable solvent, for example methanol or ethyl acetate or a mixture thereof, or via chiral 5 chromatography using an optically active stationary phase.

Alternatively, any stereoisomer of a compound of the structural formula I may be obtained by stereospecific synthesis using optically pure starting materials or reagents of known configuration.

The stereochemistry of the substituents at the C-2 and C-3 positions of 10 the furanose ring of the compounds of the present invention of structural formula I is denoted by squiggly lines which signifies that substituents R1, R2, R3 and R4 can have either the  $\alpha$  (substituent "down") or  $\beta$  (substituent "up") configuration independently of one another. Notation of stereochemistry by a bold line as at C-1 and C-4 of the furanose ring signifies that the substituent has the  $\beta$ -configuration 15 (substituent "up").

The compounds of the present invention may be administered in the form of a pharmaceutically acceptable salt. The term "pharmaceutically acceptable salt" refers to salts prepared from pharmaceutically acceptable non-toxic bases or 20 acids including inorganic or organic bases and inorganic or organic acids. Salts of

basic compounds encompassed within the term "pharmaceutically acceptable salt" refer to non-toxic salts of the compounds of this invention which are generally prepared by reacting the free base with a suitable organic or inorganic acid.

Representative salts of basic compounds of the present invention include, but are not limited to, the following: acetate, benzenesulfonate, benzoate, bicarbonate, bisulfate, bitartrate, borate, bromide, camsylate, carbonate, chloride, clavulanate, citrate, dihydrochloride, edetate, edisylate, estolate, esylate, fumarate, gluceptate, gluconate, glutamate, glycolylarsanilate, hexylresorcinate, hydrabamine, hydrobromide, hydrochloride, hydroxynaphthoate, iodide, isothionate, lactate, lactobionate, laurate, malate, maleate, mandelate, mesylate, methylbromide, methylnitrate, methylsulfate, mucate, napsylate, nitrate, N-methylglucamine ammonium salt, oleate, oxalate, pamoate (embonate), palmitate, pantothenate, phosphate/diphosphate, polygalacturonate, salicylate, stearate, sulfate, subacetate, succinate, tannate, tartrate, teoclate, tosylate, triethiodide and valerate. Furthermore, where the compounds of the invention carry an acidic moiety, suitable pharmaceutically acceptable salts thereof include, but are not limited to, salts derived from inorganic bases including aluminum, ammonium, calcium, copper, ferric, ferrous, lithium, magnesium, managanic, mangamous, potassium, sodium, zinc, and the like. Particularly preferred are the ammonium, calcium, magnesium, potassium, and sodium salts. Salts derived from pharmaceutically acceptable organic non-toxic bases include salts of primary, secondary, and tertiary amines, cyclic amines, and basic ion-exchange resins, such as arginine, betaine, caffeine, choline, N,N-dibenzylethylenediamine, diethylamine, 2-diethylaminoethanol, 2-dimethylaminoethanol, ethanolamine, ethylenediamine, N-ethylmorpholine, N-ethylpiperidine, glucamine, glucosamine, histidine, hydrabamine, isopropylamine, lysine, methylglucamine, morpholine, piperazine, piperidine, polyamine resins, procaine, purines, theobromine, triethylamine, trimethylamine, tripropylamine, tromethamine, and the like.

Also, in the case of a carboxylic acid (-COOH) or alcohol group being present in the compounds of the present invention, pharmaceutically acceptable esters of carboxylic acid derivatives, such as methyl, ethyl, or pivaloyloxymethyl, or acyl derivatives of alcohols, such as acetate or maleate, can be employed. Included are those esters and acyl groups known in the art for modifying the solubility or hydrolysis characteristics for use as sustained-release or prodrug formulations.

Preparation of the Nucleoside Compounds and Derivatives of the Invention

The nucleoside compounds and derivatives thereof of the present invention can be prepared following synthetic methodologies well-established in the practice of nucleoside and nucleotide chemistry. Reference is made to the following text for a description of synthetic methods used in the preparation of the compounds of the present invention: "Chemistry of Nucleosides and Nucleotides," L.B. Townsend, ed., Vols. 1-3, Plenum Press, 1988, which is incorporated by reference herein in its entirety.

5 The synthesis of 9-(2'-C-methyl- $\beta$ -D-ribofuranosyl)purines of structural formula VIII is described in U.S. Patent No. 3,480,613, the contents of which are incorporated herein in their entirety.

A representative general method for the preparation of compounds of the present invention is outlined in Scheme 1 below. This scheme illustrates the synthesis of compounds of the present invention of structural formula 1-7 wherein the furanose ring has the  $\beta$ -D-ribo configuration. The starting material is a 3,5-bis-O-protected alkyl furanoside, such as methyl furanoside, of structural formula 1-1. The C-2 hydroxyl group is then oxidized with a suitable oxidizing agent, such as a chromium trioxide or chromate reagent, Dess-Martin periodinane, or by Swern oxidation, to afford a C-2 ketone of structural formula 1-2. Addition of a Grignard reagent, such as an alkyl, alkenyl, or alkynyl magnesium halide (for example, MeMgBr, EtMgBr, vinylMgBr, allylMgBr, and ethynylMgBr) or an alkyl, alkenyl, or alkynyl lithium, such as MeLi, across the carbonyl double bond of 1-2 in a suitable organic solvent, such as tetrahydrofuran, diethyl ether, and the like, affords the C-2 tertiary alcohol of structural formula 1-3. A good leaving group (such as Cl, Br, and I) is next introduced at the C-1 (anomeric) position of the furanose sugar derivative by

treatment of the furanoside of formula 1-3 with a hydrogen halide in a suitable organic solvent, such as hydrogen bromide in acetic acid, to afford the intermediate furanosyl halide 1-4. A C-1 sulfonate, such methanesulfonate (MeSO<sub>2</sub>O-), trifluoromethane-sulfonate (CF<sub>3</sub>SO<sub>2</sub>O-), or p-toluenesulfonate (-OTs), may also serve as a useful

5 leaving group in the subsequent reaction to generate the glycosidic (nucleosidic) linkage. The nucleosidic linkage is constructed by treatment of the intermediate of structural formula 1-4 with the metal salt (such as lithium, sodium, or potassium) of an appropriately substituted *1H*-pyrrolo[2,3-d]pyrimidine 1-5, such as an appropriately substituted 4-halo-*1H*-pyrrolo[2,3-d]pyrimidine, which can be generated

10 *in situ* by treatment with an alkali hydride (such as sodium hydride), an alkali hydroxide (such as potassium hydroxide), an alkali carbonate (such as potassium carbonate), or an alkali hexamethyldisilazide (such as NaHMDS) in a suitable anhydrous organic solvent, such as acetonitrile, tetrahydrofuran, 1-methyl-2-pyrrolidinone, or N,N-dimethylformamide (DMF). The displacement reaction can be

15 catalyzed by using a phase-transfer catalyst, such as TDA-1 or triethylbenzyl-ammonium chloride, in a two-phase system (solid-liquid or liquid-liquid). The optional protecting groups in the protected nucleoside of structural formula 1-6 are then cleaved following established deprotection methodologies, such as those described in T.W. Greene and P.G.M. Wuts, "Protective Groups in Organic

20 Synthesis," 3<sup>rd</sup> ed., John Wiley & Sons, 1999. Optional introduction of an amino group at the 4-position of the pyrrolo[2,3-d]pyrimidine nucleus is effected by treatment of the 4-halo intermediate 1-6 with the appropriate amine, such as alcoholic ammonia or liquid ammonia, to generate a primary amine at the C-4 position (-NH<sub>2</sub>), an alkylamine to generate a secondary amine (-NHR), or a dialkylamine to generate a

25 tertiary amine (-NRR'). A 7*H*-pyrrolo[2,3-d]pyrimidin-4(3*H*)one compound may be derived by hydrolysis of 1-6 with aqueous base, such as aqueous sodium hydroxide. Alcoholysis (such as methanolysis) of 1-6 affords a C-4 alkoxide (-OR), whereas treatment with an alkyl mercaptide affords a C-4 alkylthio (-SR) derivative. Subsequent chemical manipulations well-known to practitioners of ordinary skill in

30 the art of organic/medicinal chemistry may be required to attain the desired compounds of the present invention.

EXAMPLE 1

4-Amino-7-(2-C-methyl-β-D-arabinofuranosyl)-7H-pyrrolo[2,3-d]pyrimidine

To chromium trioxide (1.57 g, 1.57 mmol) in dichloromethane (DCM) (10 mL) at 0°C was added acetic anhydride (145 mg, 1.41 mmol) and then pyridine (245 mg, 3.10 mmol). The mixture was stirred for 15 min, then a solution of 7-[3,5-O-[1,1,3,3-tetrakis(1-methylethyl)-1,3-disiloxanediyl]-β-D-ribofuranosyl]-7H-pyrrolo[2,3-d]pyrimidin-4-amine [for preparation, see J. Am. Chem. Soc. 105: 4059 (1983)] (508 mg, 1.00 mmol) in DCM (3 mL) was added. The resulting solution was stirred for 2 h and then poured into ethyl acetate (10 mL), and subsequently filtered through silica gel using ethyl acetate as the eluent. The combined filtrates were evaporated in vacuo, taken up in diethyl ether/THF (1:1) (20 mL), cooled to -78°C and methylmagnesium bromide (3M, in THF) (3.30 mL, 10 mmol) was added dropwise. The mixture was stirred at -78°C for 10 min, then allowed to come to room temperature (rt) and quenched by addition of saturated aqueous ammonium chloride (10 mL) and extracted with DCM (20 mL). The organic phase was evaporated in vacuo and the crude product purified on silica gel using 5% methanol in dichloromethane as eluent. Fractions containing the product were pooled and evaporated in vacuo. The resulting oil was taken up in THF (5 mL) and 25 tetrabutylammonium fluoride (TBAF) on silica (1.1 mmol/g on silica) (156 mg) was added. The mixture was stirred at room temperature for 30 min, filtered, and evaporated in vacuo. The crude product was purified on silica gel using 10%

methanol in dichloromethane as eluent. Fractions containing the product were pooled and evaporated *in vacuo* to give the desired compound (49 mg) as a colorless solid.

The triphosphate derivatives were purified by anion exchange (AX) chromatography using a 30 x 100 mm Mono Q column (Pharmacia) with a buffer system of 50 mM Tris, pH 8. Elution gradients were typically from 40 mM NaCl to 0.8 M NaCl in two column volumes at 6.5 mL/min. Appropriate fractions from anion exchange chromatography were collected and desalted by reverse-phase (RP) chromatography using a Luna C18 250 x 21 mm column (Phenomenex) with a flow rate of 10 mL/min. Elution gradients were generally from 1% to 95% methanol in 14 min at a constant concentration of 5 mM triethylammonium acetate (TEAA).

Mass spectra of the purified triphosphates were determined using on-line HPLC mass spectrometry on a Hewlett-Packard (Palo Alto, CA) MSD 1100. A Phenomenex Luna (C18(2)), 150 x 2 mm, plus 30 x 2 mm guard column, 3- $\mu$ m particle size was used for RP HPLC. A 0 to 50% linear gradient (15 min) of acetonitrile in 20 mM TEAA (triethylammonium acetate) pH 7 was performed in series with mass spectral detection in the negative ionization mode. Nitrogen gas and a pneumatic nebulizer were used to generate the electrospray. The mass range of 150-900 was sampled. Molecular masses were determined using the HP Chemstation analysis package.

The purity of the purified triphosphates was determined by analytical RP and AX HPLC. RP HPLC with a Phenomenex Luna or Jupiter column (250 x 4.6 mm), 5- $\mu$ m particle size was typically run with a 2-70% acetonitrile gradient in 15 min in 100 mM TEAA, pH 7. AX HPLC was performed on a 1.6 x 5 mm Mono Q column (Pharmacia). Triphosphates were eluted with a gradient of 0 to 0.4 M NaCl at constant concentration of 50 mM Tris, pH 8. The purity of the triphosphates was generally >80%.

Step A: 3,5-Bis-(2,4-dichlorophenylmethyl)-2-C-vinyl-1-O-methyl-α-D-ribofuranose

20

Cerium chloride heptahydrate (50 g, 134.2 mmol) was finely crushed in a pre-heated mortar and transferred to a round-bottom flask equipped with a mechanical stirrer. The flask was heated under high vacuum overnight at 160°C. The vacuum was released under argon and the flask was cooled to room temperature.

5 Anhydrous THF (300 mL) was cannulated into the flask. The resulting suspension was stirred at room temperature for 4 h and then cooled to -78 °C. Vinylmagnesium bromide (1M in THF, 120 mL, 120 mmol) was added and stirring continued at -78 °C for 2 h. To this suspension was added a solution of 3,5-bis-*O*-(2,4-dichlorophenylmethyl)-1-*O*-methyl- $\alpha$ -D-erythro-pentofuranose-2-ulose (14 g, 30 mmol) [from Example 2, Step B] in anhydrous THF (100 mL), dropwise with constant stirring. The reaction was stirred at -78 °C for 4 h. The reaction was quenched with saturated ammonium chloride solution and allowed to come to room temperature. The mixture was filtered through a celite pad and the residue washed with Et<sub>2</sub>O (2 × 500 mL). The organic layer was separated and the aqueous layer extracted with Et<sub>2</sub>O (2 × 200 mL). The combined organic layers were dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated to a viscous yellow oil. The oil was purified by flash chromatography (SiO<sub>2</sub>, 10% EtOAc in hexanes). The title compound (6.7 g, 13.2 mmol) was obtained as a pale yellow oil.

20 **Step B:** 4-Chloro-7-[3,5-bis-*O*-(2,4-dichlorophenylmethyl)-2-C-vinyl- $\beta$ -D-ribofuranosyl]-7*H*-pyrrolo[2,3-*d*]pyrimidine

To a solution of the compound from Step A (6.4 g, 12.6 mmol) in anhydrous dichloromethane (150 mL) at -20 °C was added HBr (30% solution in AcOH, 20 mL, 75.6 mmol) dropwise. The resulting solution was stirred between -10°C and 0°C for 4 h, evaporated in vacuo and co-evaporated with anhydrous toluene (3 × 40 mL). The oily residue was dissolved in anhydrous acetonitrile (100 mL) and added to a solution of the sodium salt of 4-chloro-1*H*-pyrrolo[2,3-*d*]pyrimidine (5.8 g, 37.8 mmol) in acetonitrile (generated in situ as described in Example 2) at -20 °C. The resulting mixture was allowed to come to room temperature and stirred at room temperature for 24 h. The mixture was then evaporated to dryness, taken up in water and extracted with EtOAc (2 × 300 mL). The combined extracts were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated. The crude mixture was purified by flash chromatography (SiO<sub>2</sub>, 10% EtOAc in hexanes) and the title compound (1.75 g) isolated as a white foam.

### BIOLOGICAL ASSAYS

The assays employed to measure activity against vaccinia virus are described below:

30

a. Determination of In Vitro Antiviral Activity of Compounds Against Vaccinia Virus (Cytopathic Effect Inhibition Assay):

35

Assay conditions are described in the article by Sidwell and Huffman, "Use of disposable microtissue culture plates for antiviral and interferon induction studies," Appl. Microbiol. 22: 797-801 (1971).

Vaccinia virus, Lederle strain from the ATCC, was used with Vero cells and media (9% fetal bovine serum, 0.1% NaHCO<sub>3</sub>, no antibiotics) as stated in the article. Antiviral test medium was MEM with 2% FBS and 0.18% NaHCO<sub>3</sub>.

5        Four and seven point titrations were used to assay compound inhibition. Final compound concentrations for 4-point titrations were 100, 10, 1, and 0.1  $\mu$ M. Seven-point titrations were performed by preparing one-half log serial dilutions from maximum compound concentrations of either 100  $\mu$ M or 320  $\mu$ M. Virus was added to the assay plate approximately 5 min after the test compound.

10      Assay plates were incubated with humidified air and 5% CO<sub>2</sub> at 37°C. Cytotoxicity was monitored in the control cells microscopically for morphologic changes. Regression analysis of the virus CPE data and the toxicity control data gave the ED<sub>50</sub> (50% effective dose) and CC<sub>50</sub> (50% cytotoxic concentration). The selectivity index (SI) was calculated by the formula: SI = CC<sub>50</sub>  $\div$  ED<sub>50</sub>.

15      (S)-1-[3-hydroxy-2-(phosphonylmethoxy)-propyl]cytosine (cidofovir) was used as a positive control for anti-vaccinia virus testing.

Representative compounds tested in the anti-vaccinia virus assay exhibited EC<sub>50</sub>'s less than 100 micromolar.

20      b. Determination of In Vitro Antiviral Activity of Compounds Against Vaccinia Virus (Neutral Red Uptake Assay)

After performing the CPE inhibition assay above, an additional cytopathic detection method was used. McManus described the detection method in "Microtiter Assay for Interferon: Microspectrophotometric Quantitation of 25      Cytopathic Effect," Appl. Environ. Microbiol., 31: 35-38 (1976). A Model EL309 microplate reader (Bio-Tek Instruments Inc.) was used at 540 nm to directly read the assay plate. ED<sub>50</sub> and CD<sub>50</sub> were calculated as above.

30      The nucleoside derivatives of the present invention were also evaluated for cellular toxicity and antiviral specificity in the counterscreens described below.

Blank reactions excluding enzyme and control reactions excluding test compound were also prepared using enzyme dilution buffer and test compound solvent, respectively. The reaction was initiated with reaction buffer with components as listed above. The reaction was incubated for 1 h at 37°C. The reaction was quenched by the addition of 20  $\mu$ L 0.5M

The filter disks were repeatedly washed with 150 mL 0.3M ammonium formate, pH 8 until 1 mL of wash is < 100 cpm. The disks were washed twice with 150 mL absolute ethanol and once with 150 mL anhydrous ether, dried and counted in 5 mL scintillation fluid.

The percentage of inhibition was calculated according to the following equation: % inhibition = [1-(cpm in test reaction - cpm in blank)/(cpm in control reaction - cpm in blank)] x 100.

10 **b. Inhibition of Human DNA Polymerase gamma :**

Reactions were 15 allowed to proceed for 1 h at 37°C and were quenched by addition of 0.5 M EDTA to a final concentration of 142 mM. Product formation was quantified by anion exchange filter binding and scintillation counting. Compounds were tested at up to 50  $\mu$ M.

20 The percentage of inhibition was calculated according to the following equation: % inhibition = [1-(cpm in test reaction - cpm in blank)/(cpm in control reaction - cpm in blank)] x 100.

25 The ability of the purine nucleoside derivatives of the present invention to inhibit HIV infectivity and HIV spread was measured in the following assays.

Assays were performed with a variant of HeLa Magi cells expressing both CXCR4 and CCR5 selected for low background  $\beta$ -galactosidase ( $\beta$ -gal) 30 expression. Cells were infected for 48 h, and  $\beta$ -gal production from the integrated HIV-1 LTR promoter was quantified with a chemiluminescent substrate (Galactolight Plus, Tropix, Bedford, MA). Inhibitors were titrated (in duplicate) in twofold serial dilutions starting at 100  $\mu$ M; percent inhibition at each concentration was calculated in relation to the control infection.

d. Inhibition of HIV Spread

The ability of the compounds of the present invention to inhibit the spread of the human immunodeficiency virus (HIV) was measured by the method described in U.S. Patent No. 5,413,999 (May 9, 1995), and J.P. Vacca, et al., Proc. Natl. Acad. Sci., 91: 4096-4100 (1994), which are incorporated by reference herein in their entirety.

The nucleoside derivatives of the present invention were also screened for cytotoxicity against cultured hepatoma (HuH-7) cells containing a subgenomic 10 HCV Replicon in an MTS cell-based assay as described in the assay below. The HuH-7 cell line is described in H. Nakabayashi, et al., Cancer Res., 42: 3858 (1982).

e. Cytotoxicity assay:

Cells were plated at 15-20,000 cells/well in 100  $\mu$ L of appropriate 15 media and incubated 18 h at 37°C, 5% CO<sub>2</sub>. 100  $\mu$ L of compound diluted in complete media was added to the cells for a final of 1% DMSO concentration. The plates were incubated at 37°C and 5% CO<sub>2</sub> for 24 h. After the incubation period, 40  $\mu$ L of CellTiter 96 Aqueous One Solution Cell Proliferation Assay reagent (MTS) (Promega) was added to each well, and the plates were incubated at 37°C and 5% CO<sub>2</sub> 20 for 1 h. The plates were agitated to mix well and absorbance at 490 nm was read using a plate reader. Metabolically active cells reduce MTS to formazan. Formazan absorbs at 490 nm. The absorbance at 490 nm in the presence of compound was compared to absorbance in cells without any compound added.
